1. Abstract:

We know that Vtop is an efficient college website dedicated to Students, Teachers, and Alumni. In this project we are automating some basic activities which are done manually in VIT (Vellore Institute of Technology) Vellore. We tried to automate activities such as late-night permission, room maintenance, teacher appointments. All the activities which we are automating saves a lot of resources to VIT and saves the user's time. We may also add a better events page where you can download templates for letters which are officially used in VIT for example Bonafide certificate letter, Apology letter formats. Where one can use these formats to edit and mail them to respective authorities which saves resources such as paper and also writing time. The main purpose of all these automations is to save a lot of paper used to do these activities. These automations are theoretically proven beneficial in a university scenario and saves some cost of revenue for the university as well. With these automations to Vtop, Vit can just discard a lot of registers.

2. Introduction:

VTOP being an optimal website it has its own backdrops. For starters there can be a numerous addition to VTOP, change in UI to make it student friendly and much more. Considering these issues, we came with a few features to add to VTOP to make some of the physical works automated. Such as adding a student appointment module helps students to meet teachers at a fixed time and there, we will eliminate all the time students wait in front of empty cabins. This synchronizes teachers with students as well as students with teachers in the same way. The second feature we can add is room maintenance feature where the student can raise a ticket for the room service being it to be an electrical issue or for cleaning purpose. By 8 am every morning the database of the room services will be updated and the list of required services will be issued to staff to engage in their works. These features eliminate the use of paper resources too and saves a lot of time. To make this possible we used php in our project in order to achieve the database operations and took a little help from bootstrap for the frontend. Used JavaScript for some dynamic operations in the frontend.

3. Problem Statement:

Automating some of the physical activities processed in Vit using Vtop. The activities such as issuing a slip for late night permission in the library, writing details of one's room in a register to get their room cleaned, remembering formats of letters given to different offices in Vit, meeting a professor without any knowledge whether the professor was free or not.

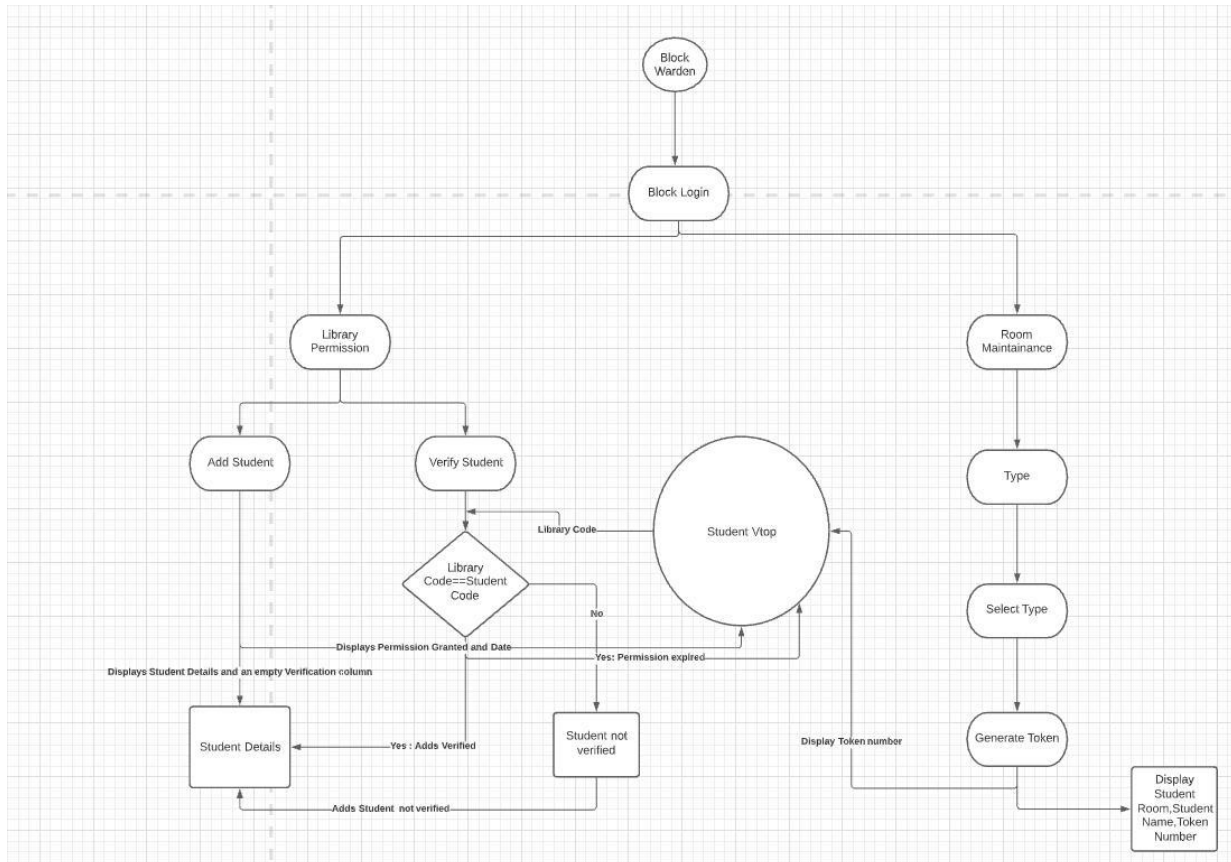

Reason for choosing this Topic?

We chose this topic, because we thought that we can automate some of the fields where Vit is still using old school methods like maintaining physical records where there is no necessity of them for a long run. Places where slips are issued for student authentication can be changed

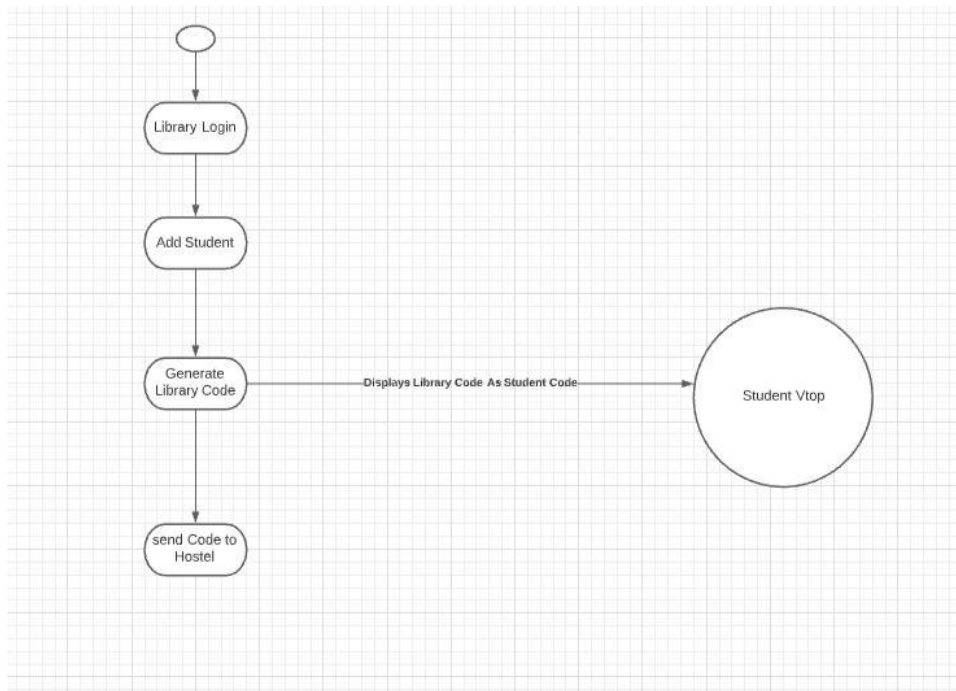

using the proposed system. This system saves a lot of paper and ensures contact less processing which is very crucial in the current world scenario.

4. Process Flow Diagram:

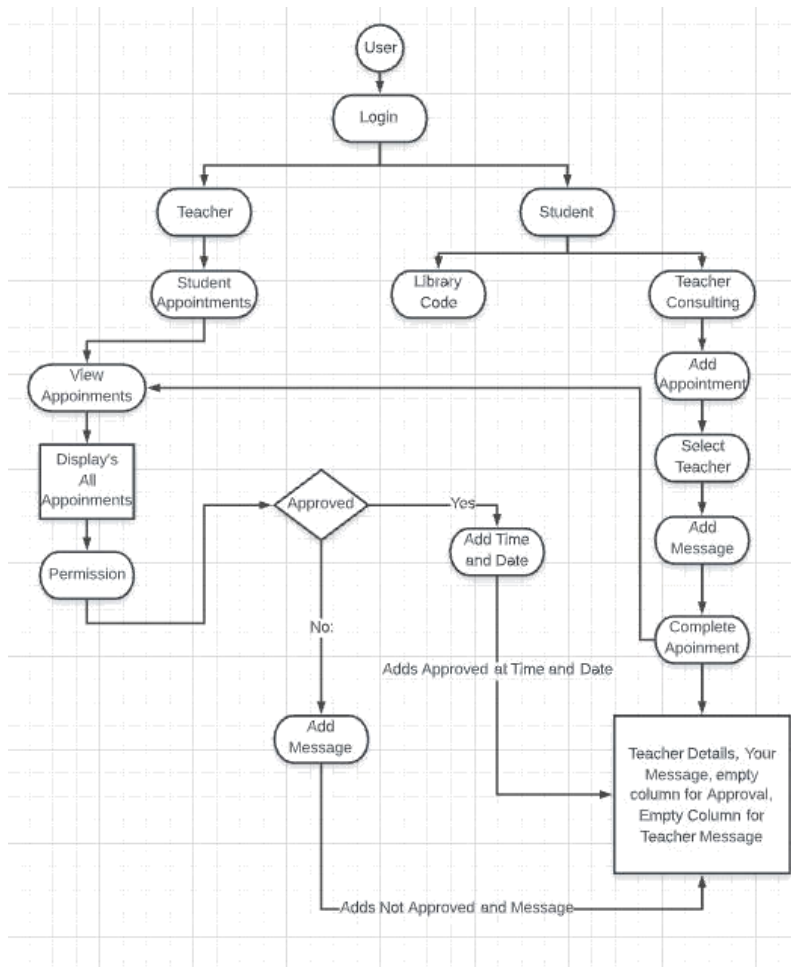

Hostel System

Library system

Teacher appointment

5. Modules

The main users of these systems Students of Vit, Hostel staff, Library Management

a. Hostel System:

- **Block Login Module:** Gives the hostel system the functionality of maintaining different records for each block.
- **Add Student Module:** Adds the student information such as registration number, Name, and an empty verification column and an invisible library code column for storing library code of the particular student sent by the library.
- **Verify Student Module:** Verifies student who went to library by comparing the code issued by the library to student and library code sent by library to hostel to verify that the student has visited the library and returned after allowed time only.

- **Maintenance Module:** Gives functionality to the hostel system of maintaining maintenance records of the hostel block.
- **Token Generation Module:** This module helps the hostel System to generate token numbers for students for their maintenance.

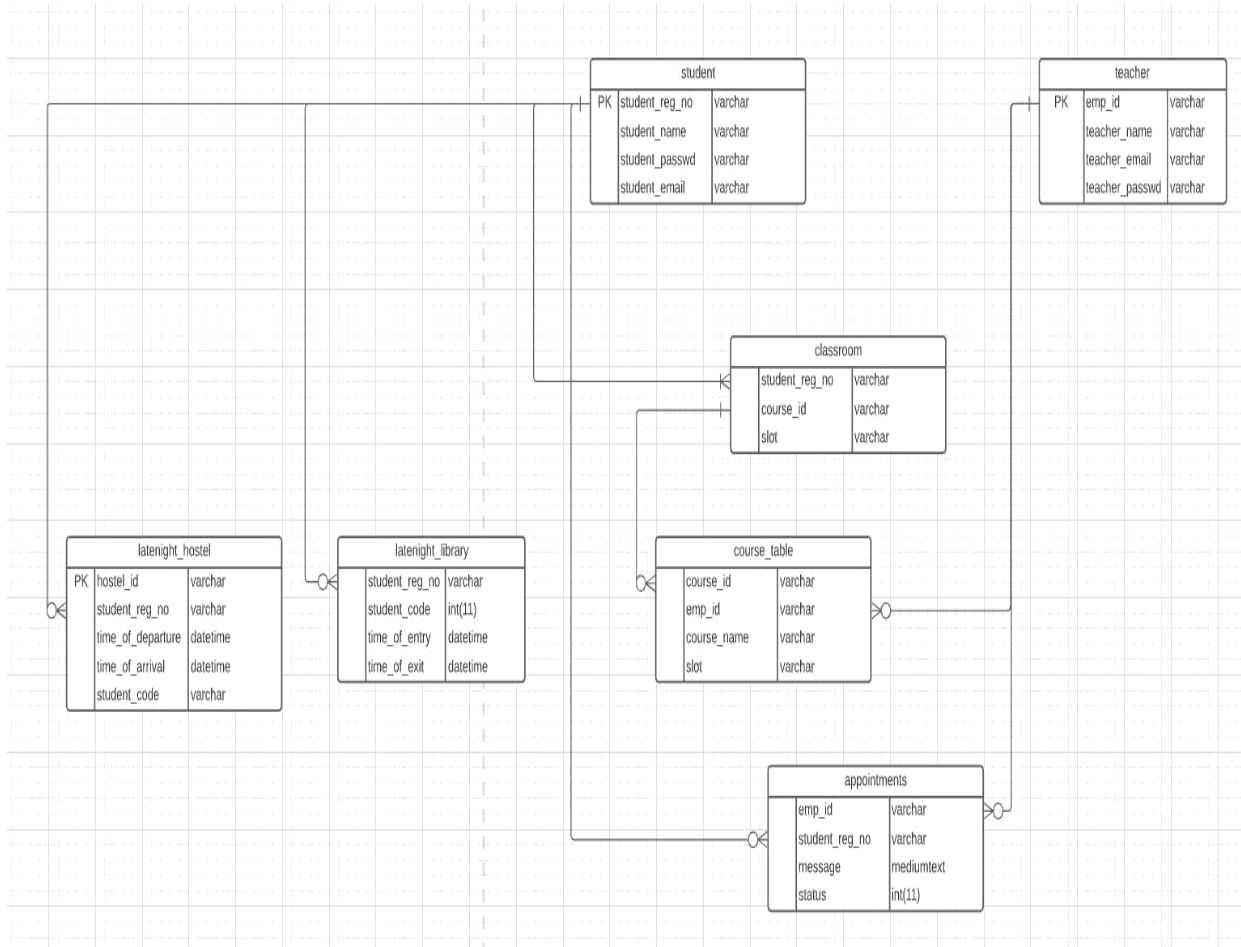

b. Library System:

- **Add Student Module:** Adds the student information registration number, name, code which is generated by Generate code Module. This Module also sends Student code to respective Hostels.
- **Generate code Module:** This Module helps the Library System to generate code to the particular student.

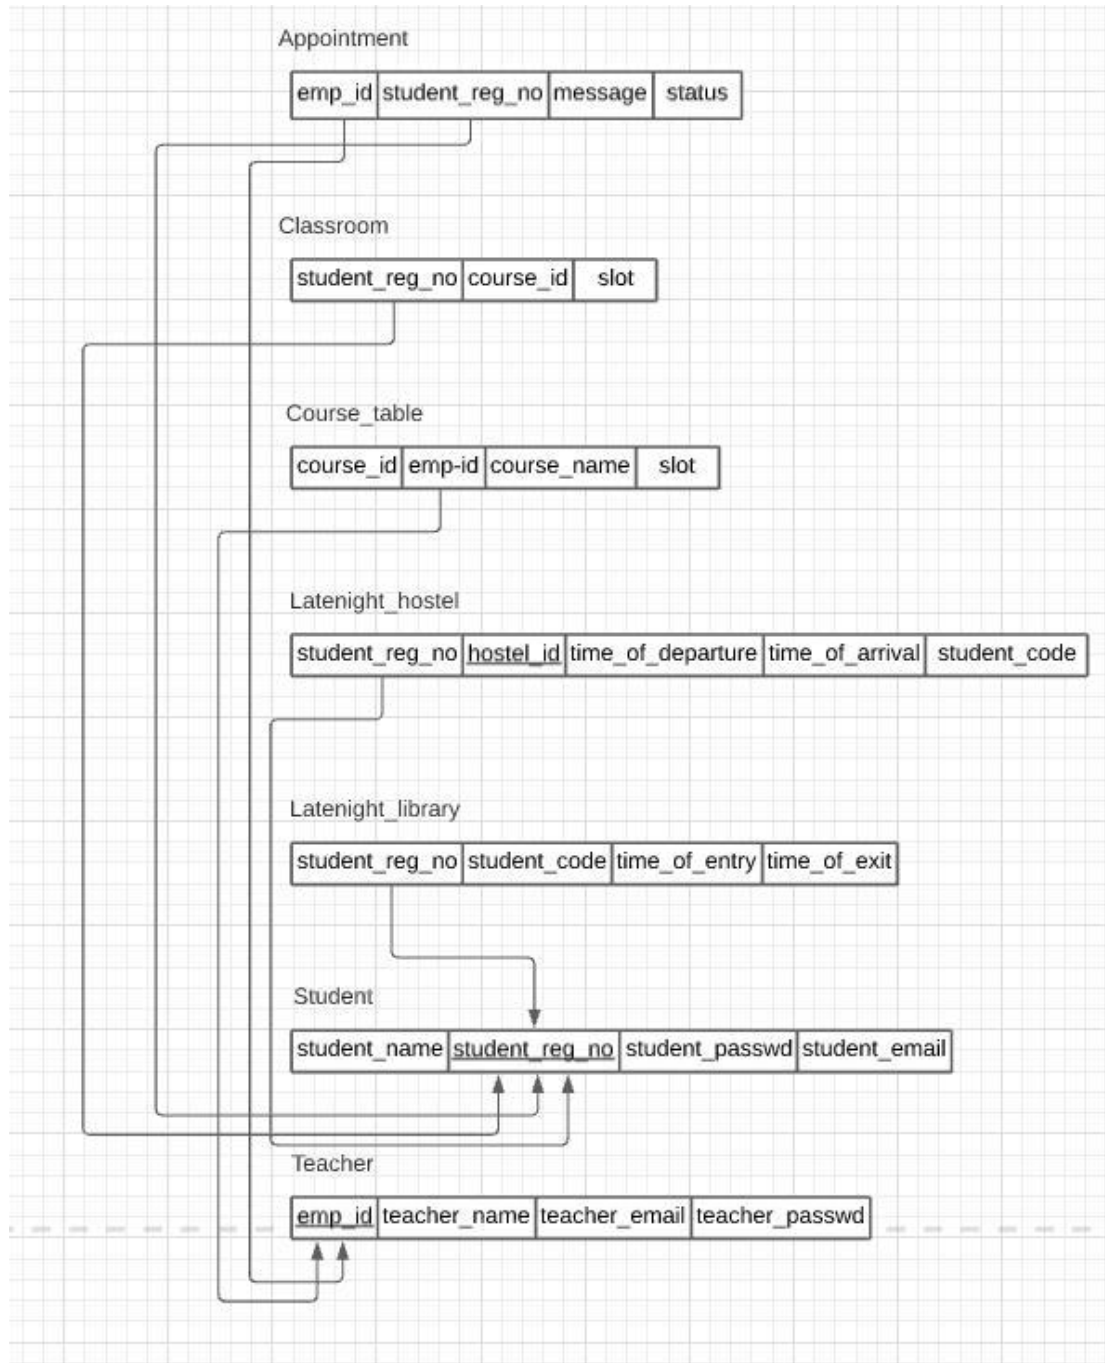

c. Teacher Appointment:

- **Login Module:** Login Module helps to maintain different databases for different users of the teacher appointment system.
- **Appointments Module:** This module helps to maintain all the appointments received by the teachers.
- **Permission Module:** This Module handles the teacher's input whether the teacher wants to give permission for an appointment or not.
- **Teacher Consulting Module:** This Module handles the Student's input from selecting the teacher to sending the appointment request to teacher.
- **Appointment submission Module:** This module handles the user input to choose whether to approve the appointment request or not which gives the teacher Consulting Module to send the appointment request to the teacher.

7. Database Design

8. Conclusion

These features can make a great addition to VTOP where students and teachers both get benefits. The UI changes make it more flexible to access the most used features. These additions also automate the physical process like having slips for Latenight permission, asking for permission and visiting the teacher later, going to hostel management room every time for registering a room service request. We can also add so many features in Vtop like a templates page, automatic email generator...etc. The options are endless for every need. Finally i conclude that Vtop can have a lot of features and we think we made some of the important features and added to it.
